

A COMPOSITE REVIEW · THE TRUST IS INVENTED, THE PATTERNS ARE NOT

This autumn brings another return declaring you know what your trust owns. The records were already telling a different story — quietly, for years, with no one reading them.

Twenty-two iPads logged in two schools at once. A room full of laptops and interactive screens, still on the books — in a building demolished two years ago. The trust never knew. Few would have.

Drawn from real reviews. No site visit. No new software.

ESTATE INTELLIGENCE HEALTH — WHAT THE RECORDS CAN EVIDENCE

Estate Intelligence Health

How visible, reliable and protected is your estate?

CRITICAL 0–25 POOR 25–50 FAIR 50–75 STRONG 75–100

This score is not a judgement on the trust. It measures how much of the estate can be evidenced from records the trust already holds — and therefore how much a review would make visible.

An illustrative review. The trust is invented; every finding is a real Prism pattern.

THE EVIDENCE BEHIND THE VERDICT

Page one is the conclusion. This page is where it comes from — the combined position across all twenty registers, shown so your board can interrogate it.

SCHOOL PORTFOLIO — ABRIDGED

School	Phase	Pupils	IT/AV Devices	Est. Mid Value
Illustrative Primary 1	Primary	420	340	£121,000
Illustrative Primary 2	Primary	380	296	£104,000
Illustrative Primary 3	Primary	365	288	£98,000
Illustrative Secondary 1	Secondary	1180	812	£296,000
Illustrative Secondary 2	Secondary	1040	744	£262,000
Illustrative Specialist	Specialist	96	231	£84,000

TRUST TOTAL		8,140	6,840	£2,410,000

WHERE THE TWENTY REGISTERS AGREE

EXAMPLE REPORT — FOR ILLUSTRATION PURPOSES ONLY

FIVE FINDINGS — AND WHY THE FIFTH IS THE ONE THAT MATTERS

These are the patterns a Prism review typically surfaces, in the order they tend to land. Read them in sequence: each is small on its own, and together they arrive somewhere the trust had never looked. Every finding is a statement about the records themselves — where the records are silent, the review says so rather than guessing.

A NOTE ON WHAT THESE FINDINGS SAY ABOUT A TRUST

Nothing in these findings is unusual. Zero purchase dates, sparse warranty data and internal contradictions are the norm across almost every trust we review — these gaps were built into registers years ago, long before anyone now in post arrived. What is unusual is seeing them in one place, priced, before an auditor or insurer does. That is the position a review like this puts a board in.

Twenty-two iPads your records place in two schools at once.

- 1 Twenty-two serial numbers appear against devices in more than one school at the same time — the same physical iPads, apparently in two buildings. On its own, a small thing. But it is the first sign that the register has quietly drifted out of step with itself, unnoticed simply because nothing in a normal year reads all twenty schools against each other.

Found in the records — serial-number cross-check across 20 registers.

Laptops and interactive screens still on the books — in a building demolished two years ago.

- 2 A room's worth of equipment — laptops, interactive screens — remains on the register and the insurance schedule, logged to a space lost in a 2023 rebuild. Alongside it, assets dated to the future and acquisitions recorded after disposal. Individually, clerical drift. Together, a register that can no longer stand as evidence of what the trust actually holds.

Found in the records — date and location field validation across 20 registers.

Half a million pounds of estate the trust is quietly under-declaring.

- 3 Declared at £1.90m, the same equipment priced at replacement cost comes to £2.41m — a £510,000 gap the trust would absorb in a total-loss claim. This is arithmetic on the trust's own figures. And it sits alongside equipment still declared at full value that no longer exists at all.

Found in the records — declared values against replacement pricing, 20 registers.

Nineteen of twenty schools cannot tell you how old a single device is.

- 4 Purchase dates were never captured when the registers were built — normal, and no one's fault. But it means the trust cannot evidence the age of any device, cannot plan a refresh on fact rather than guess, and cannot answer the first question an auditor asks. The gap has been there for years, unseen.

Found in the records — Purchase Date column, blank in 19 of 20 registers.

None of the above was the real problem.

- 5 The real point is quieter, and it is not a failing. A competent, well-run trust held all of this in its own records and had simply never seen it — because nothing in the ordinary run of a year reads twenty registers against each other and against reality. The findings were always there, waiting to be read. The trust in this review hadn't looked, and few would have. Reading the records properly, before anyone else has to, is the whole of what a Prism review does.

The pattern behind every Prism review — the pattern across every review Prism has produced.

EXAMPLE REPORT — FOR ILLUSTRATION PURPOSES ONLY

WHAT YOUR REGISTER CANNOT TELL YOU

This review is built from the records you hold, so it is honest about their limits. The following cannot be established from a register alone — stating them plainly is what makes everything else in this report trustworthy.

Whether any specific asset is still physically in the building — a register records what was entered, not what is present. Confirming it needs an onsite audit.

How old each device actually is — with no purchase dates, age can only be estimated, never evidenced, from the file.

Which devices remain under manufacturer support — warranty data typically covers under 15% of assets.

Whether declared insurance values reflect today's replacement cost — in reviews like this one they rarely do, and the register alone cannot confirm each entry.

THESE GAPS ARE CLOSABLE

Every gap here is closable. Purchase dates and warranty status come from a short supplier-records exercise; physical presence and condition come from an onsite verification audit. A Prism review shows you precisely which gaps are worth closing first — it does not pretend to have closed the ones it cannot see from your records.

THE NEXT LAYER — YOUR COMPLIANCE RECORDS, READ TOGETHER

This showcase was built from asset registers alone. But an asset register is only one of the record sets a trust already holds. Every year a trust pays for a stack of statutory compliance documents — and, like the registers, they are filed separately and rarely read across one another. That is where the next layer of intelligence sits.

RECORDS A TRUST ALREADY COMMISSIONS EVERY YEAR

- Condition surveys
- Fixed wiring (EICR) reports
- Asbestos management surveys & re-inspections
- Fire risk assessments
- Water hygiene (L8) records
- Gas safety & boiler servicing certificates
- Lift inspection (LOLER) reports
- Three-to-five-year capital expenditure history

WHAT A REVIEW SURFACES WHEN THESE ARE SUPPLIED

Where compliance actions cluster — and whether that spend follows them.

Cross-referencing open actions by site against the capital plan exposes where high-risk buildings receive little investment while low-risk ones absorb it.

Equipment technically compliant, but nearing the end of its life.

A boiler or fixed installation can pass its last inspection and still be two years from failure. Read against asset age, the review flags what is compliant today and a budget risk tomorrow.

Findings that were signed off, then never actioned in a capital plan.

Recommendations from a condition survey or EICR that never made it into subsequent budgets — a governance gap an auditor or insurer can see even if the board cannot.

Insurance carried at full value on equipment rated unsatisfactory.

Where a compliance report rates an asset poor or end-of-life while it is still declared at full replacement value, the exposure sits with the trust.

Documentation gaps and overdue re-inspections.

Surveys older than five years, EICRs past their due date, asbestos re-inspections lapsed — the quiet gaps that become urgent the moment they are questioned.

SUPPLY THE DOCUMENTS — THE ANALYSIS IS INCLUDED

A forward three-year compliance pipeline — surveys falling due, certificates expiring, recommendations becoming overdue — so the board sees what is coming before it arrives. None of this requires new inspections or a site visit. It is produced by reading the compliance documents the trust already commissions each year, alongside the asset registers. Supply the documents, and this analysis is included in the review at no additional cost.

FOR YOUR NEXT TRUST BOARD MEETING

The paragraph below is written to be lifted directly into your board papers, minutes, or resources committee agenda. Change nothing, or change everything — it exists so that this review turns into a board decision, not a filed PDF.

READY TO PASTE — AGENDA ITEM / MINUTE TEXT

The Board considered an illustrative Prism Estate Intelligence Review demonstrating the findings a review of the trust's own asset registers typically surfaces: internal contradictions within the registers (the same asset logged in two schools; equipment recorded against rooms no longer in use), an insurance under-declaration of the order of £510,000, and an inability to evidence device age across the estate. The Board noted that none of these findings would emerge in the normal run of the year, and resolved to commission a review of the trust's own records ahead of the autumn annual return, retaining the output as evidence towards SFVS and SRM self-assessment.

THE THREE ACTIONS, NAMED AND OWNED

- 1

Commission a Prism review of the trust's own asset registers ahead of the autumn annual return.
Owner: CFO | Deadline: before the return | Built only from records the trust already holds
- 2

Reconcile the internal contradictions a review surfaces — duplicate serials, impossible dates, lost rooms.
Owner: CFO with school SBMs | Prism supplies per-school exception lists
- 3

Re-declare the estate at replacement value and close the recording gaps — purchase dates, warranty, pricing.
Owner: COO | 90-minute supplier-records exercise per school

The information was already there. It was sitting in twenty spreadsheets, waiting to be seen. The only question is whether you see it before the return does.
